CHAPTER 1 INTRODUCTION

The 1991 Demographic Indicators Report provides demographic information for Edmonton and for a number of different sub-areas such as census tracts, traffic districts and postal code areas. The main source is the 1991 Civic Census which was done during March and April 1991. Maps of the subareas are provided. Table 1.1 provides a summary of the census for the City of Edmonton.

Findings

- The 1991 population was 614,665 persons, an increase of 9,127 over the 1990 population of 605,538.

- The 1990 and 1991 censuses recorded an increase in the population of Edmonton's inner city (defined in Table 2.1). This is in contrast to previous censuses which recorded continuing population declines. Much of the 11,000 increase in 1990 in the inner city and may have resulted from a change in the way the census was administered. But the further increase in 1991, although much smaller, suggests that the inner city's population is stabilizing.

- After decreasing since the 1960's, Edmonton's household size increased in 1990 to 2.55 and to 2.56 in 1991 (Table 1.2). This increase probably occurred in response to the combined effects of economic recession and a tighter apartment rental market.

- The annual household growth rate between 1989 and 1991 was lower than the population growth rate. This is in

- The greatest change in Edmonton's population age profile since 1987 has been the decrease in the young adult group (ages 20-29) from 23% of the population to 20% of the population in 1991 (Table 2.1).

contrast to the 1970s and 1980s when the household growth rate increased faster than the population growth rate.

- Map 1 shows population change between 1987 and 1991. Areas in both the inner city and the newer suburbs have lost and gained in population. However, the inner city contains almost all of the census tracts that have lost people, and the census tracts with the largest population gains are in the newer suburbs.

CHAPTER 2 TRAFFIC DISTRICTS

The City administration uses areas called traffic districts for some planning purposes. These areas have the same boundaries as residential areas such as Mill Woods, Riverbend or Castle Downs. A map of these areas is provided on page 5. Table 2.1 provides population for traffic districts since 1976.

Findings

Population Change

The greatest change over the last 15 years is the growth of the suburbs and the absolute population decline in the inner city. The inner city has decreased by about 48,000 people since 1976 and its share of total population has declined from 88% to 58%. Only the University traffic district in the inner city has maintained its population during this period. Jasper Place has the greatest population loss with a decline of 12,000. Mill Woods has had by far the most growth, increasing to 74,000 in 1991 from 12,000 in 1976.

Age Profile

- Mill Woods has the largest percentage (19%) of children aged 0 to 14. The inner city contains 43% of children aged under 15.

- The majority (83%) of people aged 65 and older live in the inner city. Jasper Place and North Central traffic districts contain 25% of this age group.
- People in the age group 30 to 44 are evenly distributed between the inner city and the suburbs.

Length of Residence

- The inner city contains 61% of residents living more than five years at their current address. Jasper Place and Mill Woods each have 11% of the total number of long-term residents.

- The inner city also contains the majority (64%) of residents living less than one year at their current address. The highest percentage of new residents were in the Downtown Fringe traffic district (13%) and Mill Woods (12%).

Occupation

- Retired people live in the inner city. This area contains 82% of all retired people. The Downtown Fringe, Jasper Place and North Central traffic districts each contain over 10% of the retired population.

CHAPTER 3 WARDS

Edmonton has six wards which elect aldermen to municipal government. Ward boundaries are adjusted periodically to maintain an equal distribution of voters (Map 3). With the exception of Ward 4 (Downtown) and Ward 6 (southeast), the wards have similar age profiles.

Ward 4 has a much lower percentage of people aged under 20 and Ward 6 has a higher percentage of people aged under 20. Figure 3.7 indicates the occupation of residents by ward. Except for Ward 4 (Downtown), the wards are similar for most categories.

CHAPTER 4 CENSUS TRACTS

This chapter presents census data by geographic areas called census tracts (see Appendix 2 for a map). The boundaries for census tracts are defined by Statistics Canada for the Census of Canada. In the newer suburbs, census tracts usually have the same boundaries as neighbourhoods. However, in the inner city, census tracts often cross neighbourhood boundaries. The boundaries of census tracts are stable over time.

When a census tract reaches a threshold population (usually over 8,000), the tract is divided in two. A map of the census tracts is attached at the back of the report. Table 4.1 provides population and household data for census tracts for 1986, 1990 and 1991.

Population by Age

Table 4.2 provides population by age in census tracts. Map 4.1 indicates the distribution of people aged 30-44. The heaviest concentrations of this age group are in the suburbs and in a few areas of the inner city.

Map 4.2 indicates the distribution of people aged 65 and older. The highest concentration of this age group are in the inner city. The density decreases towards the suburbs.

The "Boomers" Ages 30-44

Population by Length of Residence

Table 4.3 presents population by length of residence. Map 4.3 indicates the distribution of people who have lived at their 1991 address for less than one year and who moved from elsewhere in Edmonton. The suburbs have high densities of recent movers but so do many areas in the inner city.

Map 4.4 indicates the distribution of people who have lived at their 1991 address for five years or more. Of the newer suburban areas, Mill Woods, Castle Downs and Clareview have the highest density of long-term residents. The south side of the inner city has a higher density of long-term residents than the north side. Map 4.4 shows the distribution of people who have moved to their 1991 address from elsewhere in Alberta.

Population by Occupational Status

Table 4.4 shows the geographic distribution by occupational status in each of Edmonton's 151 census tracts. The occupation categories are different from those identified in Statistics Canada's Standard Industrial Code.

The census provides only general occupational status categories. The census does have a classification for unemployment, allowing an unemployment rate for each census tract to be obtained. They give an indication of the distribution of unemployment rates within Edmonton. Edmonton's highest unemployment rates are concentrated in inner-city areas in Edmonton's north side.

People with full-time employment mainly live in the newer suburbs of Mill Woods, Riverbend, West Jasper Place, Castle Downs, the Lake District and Clareview. In the inner-city, Downtown and Westmount have the highest numbers of employed people. The distribution of people with part-time employment is similar except for downtown which has low numbers of people employed part-time.

Population by Marital Status and Sex

The civic census provides information on marital status. However, unlike the Federal Census of Canada, the marital status information in the civic census is provided on a voluntary basis and is open to biased results.

Table 4.5 provides data for males and females is five categories: single, married, divorced, widowed and other.

Findings

- Nearly every census tract contains more divorced females than males, suggesting that more divorced males may remarry than do divorced females. This finding is consistent with the U.S. experience.[1]

- There are more widowed females in every census tract, implying that females have longer life expectancy than males.

Dwellings by Type and Household by Tenure

Table 4.6 provides data on the number of dwelling units by type for each census tract. It also provides the number of households that own their own accommodation and the number of households that rent accommodation.

Findings

Of the 240,306 households in Edmonton, 51% own their accommodation and 49% rent accommodation. In 1990, the distribution was even. Map 4.6 shows the distribution of households that own accommodation.

The areas with the highest density of ownership are primarily in the suburbs. Many census tracts in the inner city have a percentage of owner households in the range of 0 to 30%.

Map 4.7 shows the distribution of households that rent accommodation. Areas with the highest density of households renting accommodation are overwhelmingly in the inner city, although there are a few areas in the suburbs with a high percentage of households renting accommodation.

CHAPTER 5 POPULATION AND INCOME BY POSTAL CODE AREAS

Table 5.1 shows 1989 median individual total income per income tax return for postal code areas in Edmonton and several demographic characteristics such as the number of households and people in the area.

Findings

The area with the highest median individual income ($33,700) is the Riverbend area south of 45 Avenue.

Downtown and the areas including Westmount, Inglewood, North Glenora and Woodcroft have the highest percentage (21%) of residents who are retired.

The area with the highest mean age (42) is Downtown, while Mill Woods east of 66 Street has the lowest (26) mean age.

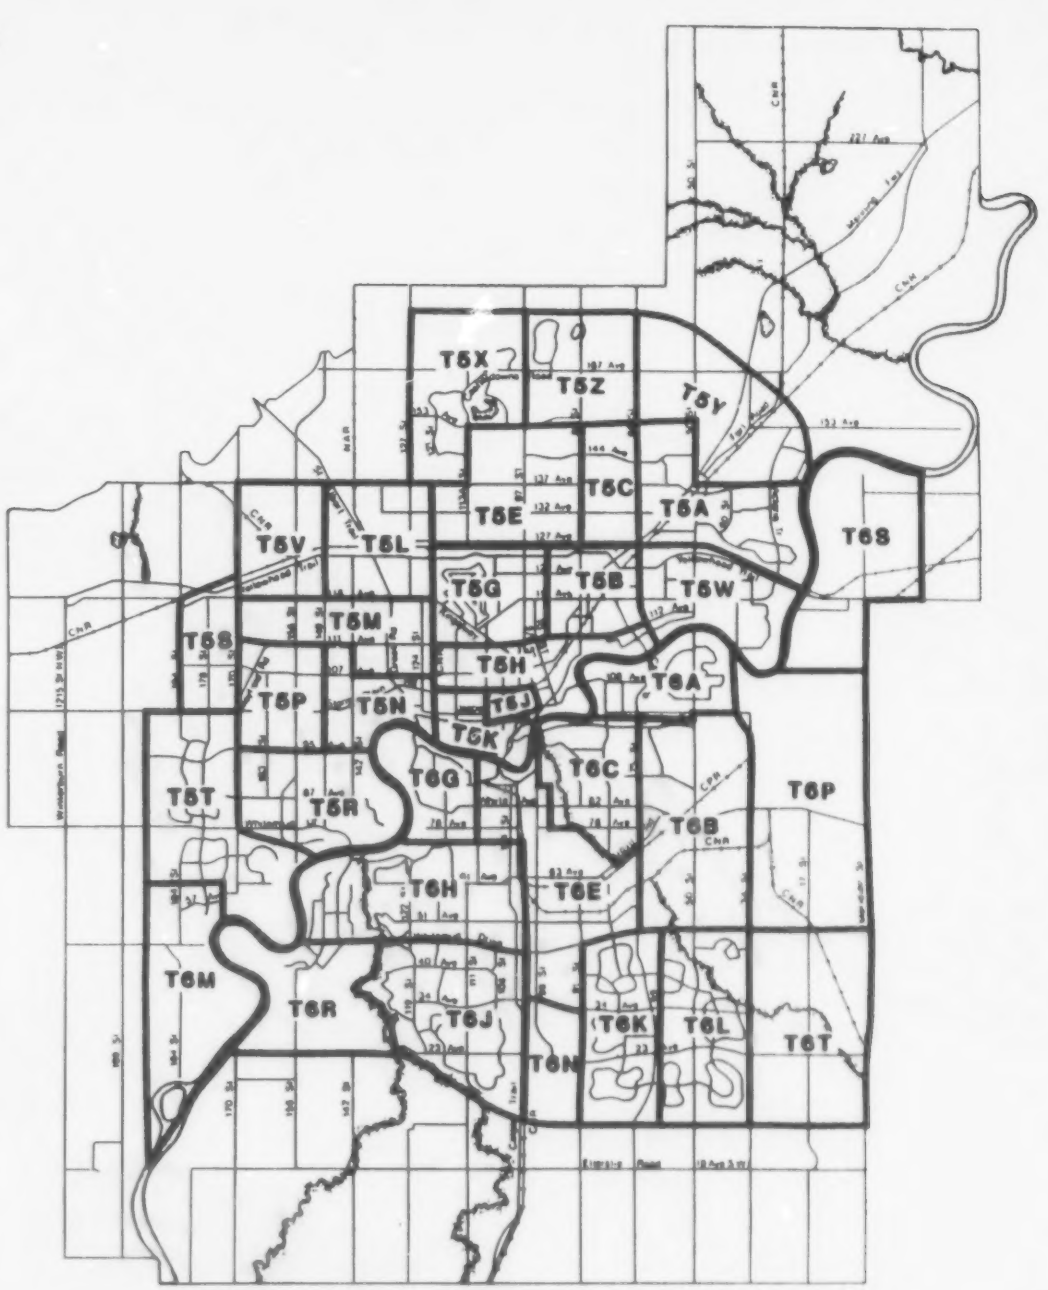
EDMONTON POSTAL CODE AREAS

Map 5.1



CHAPTER 6 POPULATION PROJECTIONS FOR EDMONTON AND SUBAREAS

This chapter contains a set of population projections for Edmonton which are presented in Table 6.1. The projections present males and females by five-year age groups.

These projections are the official City of Edmonton forecasts until February 1992, when a new projection will be prepared using different assumptions for fertility and migration. Table 6.2 presents a set of population forecasts for 31 sub-areas of Edmonton (see Map 2, page 7).

Findings

Edmonton's population is forecasted to increase by some 171,000 by 2004, for a total population of 785,500.

Edmonton's age structure in 2004, is forecasted to differ only slightly from that of 1991. For example, people aged 65 and older make up 9% of the total population in 1991. By 2004, this age group is forecast to increase only slightly to 10% of the population. The population aged under 20 will remain unchanged at 27% of the total. The greatest change occurs in the 45-59 age group. In 1991, this group makes up 13% of the population. By 2004, the 45-59 group (comprised of today's 30-44 year olds), will increase to 18% of the population.

*NOTE: Population increase does not equal the sum of net-migrants and natural increase. The difference is due to the manner in which the model treats net-migration. It uses as input for net-migration, in-migrants and out-migrants. The model applies fertility and mortality rates to the migrant population which produces a slightly different result than obtained by simply adding natural increase and net-migration.
